Experiment 9

StudentName: Deepanjali **UID:22BCS14571**
Branch: BE-CSE **Section/Group: IOT_639-A**
Semester: 6th **Date of Performance:04/04/2025**
Subject Name: PBLJ **Subject Code: 22CSH-359**

9.1.1.Aim: To demonstrate dependency injection using Spring Framework with Java-based configuration.

9.1.2 Objective:

Define Course and Student classes.
Use Configuration and Bean annotations to inject dependencies. Load Spring context and print student details.

9.1.3 Code:

```
// Course.java
public class Course {
    private String courseName; private
    String duration;

    public Course(String courseName, String duration) { this.courseName =
        courseName;
        this.duration = duration;
    }

    public String getCourseName() { return courseName; } public
    String getDuration() { return duration; }

    @Override
    public String toString() {
        return "Course: " + courseName + ", Duration: " + duration;
    }
}

// Student.java
public class Student { private
    String name; private Course
    course;
```

```
    public Student(String name, Course course) { this.name =
        name;
        this.course = course;
    }

    public void showDetails() { System.out.println("Student: " +
        name); System.out.println(course);
    }
}// AppConfig.java
import org.springframework.context.annotation.*;

@Configuration
public class AppConfig { @Bean
    public Course course() {
        return new Course("Java", "3 months");
    }

    @Bean
    public Student student() {
        return new Student("Aman", course());
    }
}// MainApp.java
import org.springframework.context.ApplicationContext;
import org.springframework.context.annotation.AnnotationConfigApplicationContext;

public class MainApp {
    public static void main(String[] args) { ApplicationContext
        context = new
AnnotationConfigApplicationContext(AppConfig.class); Student
        student = context.getBean(Student.class);
        student.showDetails();
    }
}
```

Output:

```
Student: Sarthak
Course: Java, Duration: 3 months
```

9.2.1 Aim: To perform CRUD operations on a Student entity using Hibernate ORM with MySQL.

Objective: Define Course and Student classes.

Use Configuration and Bean annotations to inject dependencies. Load

Spring context and print student details.

9.2.2 Code:

```
<hibernate-configuration>
    <session-factory>
        <property name="hibernate.connection.driver_class">com.mysql.cj.jdbc.Driver</property>
        <property name="hibernate.connection.url">jdbc:mysql://localhost:3306/testdb</property>
        <property name="hibernate.connection.username">root</property>
        <property name="hibernate.connection.password">password</property>
        <property
name="hibernate.dialect">org.hibernate.dialect.MySQL8Dialect</property>
        <property name="hibernate.hbm2ddl.auto">update</property>
        <mapping class="Student"/>
    </session-factory>
</hibernate-configuration>

import javax.persistence.*;

Entity
public class Student { Id
    GeneratedValue(strategy = GenerationType.IDENTITY) private int id;
    private String name; private
    int age;

    public Student() {}
    public Student(String name, int age) {
        this.name = name;
        this.age = age;
    }
```

```
    // Getters, setters, toString
}
import org.hibernate.SessionFactory; import
org.hibernate.cfg.Configuration;

public class HibernateUtil {
    private static final SessionFactory sessionFactory;

    static {
        sessionFactory = new Configuration().configure().buildSessionFactory();
    }

    public static SessionFactory getSessionFactory() { return
        sessionFactory;
    }
}

import org.hibernate.*; public

class MainCRUD {
    public static void main(String[] args) {
        Session session = HibernateUtil.getSessionFactory().openSession();

        // Create
        Transaction tx = session.beginTransaction();
        Student s1 = new Student("Aman", 22);
        session.save(s1);
        tx.commit();

        // Read
        Student student = session.get(Student.class, 1); System.out.println(student);

        // Update
        tx = session.beginTransaction();
        student.setAge(23);
        session.update(student); tx.commit();

        // Delete
        tx = session.beginTransaction(); session.delete(student);
```

```
        tx.commit();

        session.close();
    }
}
```

9.2.3 Output:

```
Student{id=1, name='     ', age=22}
Updated age to 23
Deleted student with id 1
```

9.3.1 Aim: To implement a banking system using Spring and Hibernate that ensures transaction consistency during fund transfers.

Objective:

Integrate Spring + Hibernate.
Handle transactions atomically (rollback on failure). Demonstrate success and failure cases.

Code:

```
import javax.persistence.*;

Entity
public class Account { @Id
    private int accountId; private
    String holderName; private
    double balance;

    // Constructors, getters, setters
}

import javax.persistence.*; import
java.util.Date;

@Entity
public class BankTransaction { @Id
    @GeneratedValue(strategy = GenerationType.IDENTITY) private
    int txnId;
    private int fromAcc; private
    int toAcc; private double
    amount;
    private Date txnDate = new Date();

    // Constructors, getters, setters
}
import org.hibernate.*;
import org.springframework.transaction.annotation.Transactional;
```

```
public class BankService {
    private SessionFactory sessionFactory;

    public BankService(SessionFactory sessionFactory) {
        this.sessionFactory = sessionFactory;
    }

    @Transactional
    public void transferMoney(int fromId, int toId, double amount) { Session session =
        sessionFactory.getCurrentSession();

        Account from = session.get(Account.class, fromId); Account to =
        session.get(Account.class, toId);

        if (from.getBalance() < amount) {
            throw new RuntimeException("Insufficient Balance");
        }

        from.setBalance(from.getBalance() - amount);
        to.setBalance(to.getBalance() + amount);

        session.update(from);
        session.update(to);

        BankTransaction txn = new BankTransaction(fromId, toId, amount); session.save(txn);
    }
}
@Configuration
@EnableTransactionManagement public
class AppConfig {
    @Bean
    public DataSource dataSource() {
        DriverManagerDataSource ds = new DriverManagerDataSource();
        ds.setDriverClassName("com.mysql.cj.jdbc.Driver");
        ds.setUrl("jdbc:mysql://localhost:3306/testdb"); ds.setUsername("root");
        ds.setPassword("password");
```

```
        return ds;
    }

    @Bean
    public LocalSessionFactoryBean sessionFactory() { LocalSessionFactoryBean lsf =
        new LocalSessionFactoryBean(); lsf.setDataSource(dataSource());
        lsf.setPackagesToScan("your.package");
        Properties props = new Properties();
        props.put("hibernate.dialect", "org.hibernate.dialect.MySQL8Dialect");
        props.put("hibernate.hbm2ddl.auto", "update"); lsf.setHibernateProperties(props);
        return lsf;
    }

    @Bean
    public HibernateTransactionManager transactionManager(SessionFactory sf) { return new
        HibernateTransactionManager(sf);
    }

    @Bean
    public BankService bankService(SessionFactory sf) { return new
        BankService(sf);
    }
}

public class MainApp {
    public static void main(String[] args) { AnnotationConfigApplicationContext ctx =
        new
AnnotationConfigApplicationContext(AppConfig.class);
        BankService service = ctx.getBean(BankService.class);

        try {
            service.transferMoney(101, 102, 500); System.out.println("Transaction
            Successful!");
        } catch (Exception e) {
            System.out.println("Transaction Failed: " + e.getMessage());
        }
```

```
        ctx.close();
    }
}
```

OUTPUT

```
Transaction Successful!
OR
Transaction Failed: Insufficient Balance
```
